DEMOGRAPHY

STATISTISKO DATU KRĀJUMS
COLLECTION OF STATISTICAL DATA

Rīga 2015

Statistisko datu krājumā „Demogrāfija 2015” publicēti dati par iedzīvotāju skaitu un tā izmaiņām, iedzīvotāju dzimuma, vecuma un etnisko sastāvu, demogrāfisko slodzi, noslēgtajām un šķirtajām laulībām, dzimstību, mirstību, ilgtermiņa migrāciju un valstisko piederību.

Atsākta datu publicēšana par iedzīvotāju skaitu arī pagastu līmenī. Par galvenajiem dabiskās kustības rādītājiem dati ir parādīti dinamikā, bet demogrāfijas pamatrādītājiem ir sniegti starpvalstu salīdzinājumi. Izdevumā ievietoti krāsaini grafiskie attēli un kartes. Dati par iedzīvotāju skaitu un galvenajiem demogrāfiskajiem rādītājiem pieejami Centrālās statistikas pārvaldes (turpmāk – CSP) mājaslapas datubāzē www.csb.gov.lv.

Data on the number and changes of population, gender, age and ethnic composition of population, demographic burden, marriages and divorces, fertility, mortality, long-term migration, citizenship are given in the statistical data collection "Demography 2015".

Data on the number of population are again presented at the level of a parish. Data on the main indicators of vital statistics are shown in dynamics, and international comparisons have been provided for the main demographic indicators. The publication includes colour charts. Data on the population number and key demographic indicators are available in the CSB database at home page www.csb.gov.lv.

NOSACĪTIE APZĪMĒJUMI EXPLANATION OF SYMBOLS

| | | |
|---|---------------------------|--|
| Parādība nav konstatēta | - | <i>Magnitude zero/absent</i> |
| Parādība ir konstatēta, bet tās lielums ir mazāks par pusi no lietotās mērvienības | 0.0 0.00 | <i>Magnitude less than half of unit employed</i> |
| Trūkst datu, vai tie ir apšaubāmi | ... | <i>Data not available or too uncertain for presentation</i> |
| Tabulas rindas un ailes krustpunktā esošās rūtiņas aizpildīšana loģiski nav iespējama | x | <i>Figure not applicable because column heading and stub line make entry impossible, absurd or meaningless</i> |

Demogrāfiskā situācija Latvijā Demographic situation in Latvia

Iedzīvotāju skaits un tā izmaiņas

Iedzīvotāju skaita un starptautiskās ilgtermiņa migrācijas aprēķini veikti atbilstoši Centrālās statistikas pārvaldes (turpmāk – CSP) 2012. gadā izstrādātajai iedzīvotāju skaita novērtēšanas metodei. Katram Latvijā reģistrētam iedzīvotājam ir **novērtēts** faktiskais dzīvesvietas statuss gada sākumā. Tā novērtēšanai ir izstrādāts loģistiskās regresijas modelis. Veicot novērtējumu, tiek analizēts plašs administratīvo datu klāsts personu līmenī, kā arī citu valstu dati par starptautisko ilgtermiņa imigrāciju no Latvijas. Sagatavotās informācijas kvalitāte tiek vērtēta, izmantojot CSP organizēto apsekojumu datus, pašvaldību apkopoto informāciju par izsniegtajiem pabalstiem, kā arī citu informāciju personu līmenī.

Iedzīvotāju skaits Latvijā turpina samazināties. Pēdējo piecu gadu laikā (kopš 2010. gada sākuma) iedzīvotāju skaits samazinājās par 134 tūkstošiem, un 2015. gada sākumā tas bija 1 miljons 986,1 tūkstotis. Iedzīvotāju skaita samazinājuma temps 2014. gadā bija 0,77% salīdzinājumā ar 2,16% 2010. gadā.

2014. gadā mirušo skaits pārsniedza dzimušo skaitu un valsts iedzīvotāju skaits samazinājās par 6,7 tūkstošiem, bet ilgtermiņa migrācijas rezultātā – par 8,7 tūkstošiem cilvēku. Kopš 1991. gada iedzīvotāju dabiskais pieaugums Latvijā ir negatīvs.

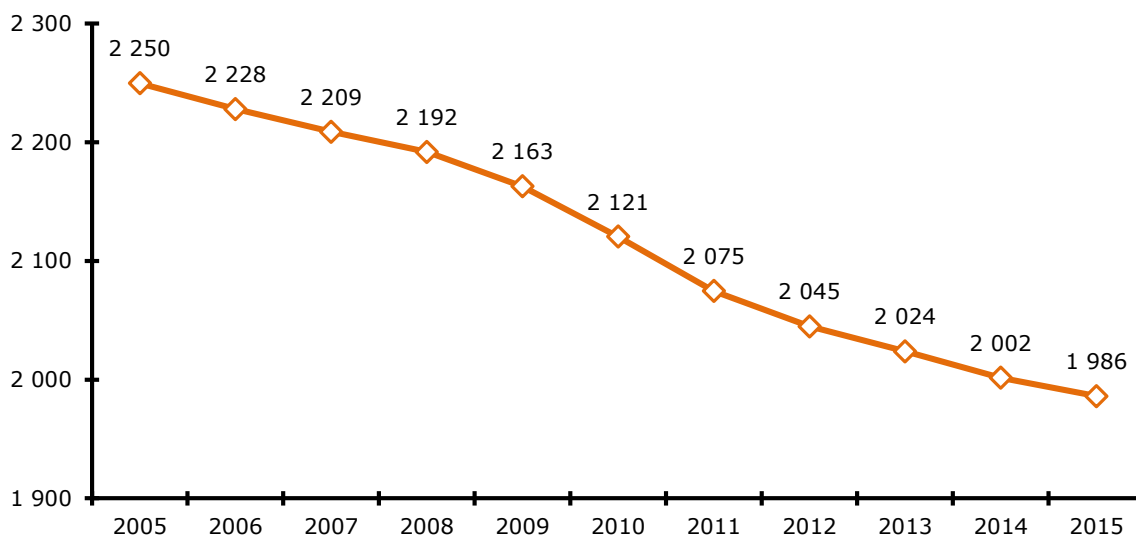

Population and population change

Calculation of the number of population and international long-term migration is based on methodology for population number estimates developed by the Central Statistical Bureau (CSB) in 2012. At the beginning of the year status of the actual place of residence is **evaluated** for each person registered in Latvia. Logistic regression model is developed for this purpose. Carrying out the evaluation, a wide range of administrative data at personal level, as well as data of other countries on international long-term immigration from Latvia are analysed. Quality of the information prepared is evaluated using data of surveys organised by the CSB, information compiled by local governments on benefits granted, as well as other information at personal level.

Population number in Latvia is still reducing. During the last five years (since the beginning of 2010), population number in the country has diminished by 134 thousand, and at the beginning of 2015 it comprised 1 million 986.1 thousand. Population decrease rate in 2014 constituted 0.77%, as compared to 2010 when it comprised 2.16%.

In 2014, as the number of deaths exceeded the number of births, Latvia population reduced by 6.7 thousand, while because of the long-term migration – by 8.7 thousand. Since 1991, natural increase in Latvia has been negative.

Iedzīvotāju skaits 2005.–2015. gada sākumā (tūkst. cilvēku)
Population number in 2005–2015 (at the beginning of the year, thsd)

2015. gada sākumā 1 miljons 348,9 tūkstoši bija pilsētu iedzīvotāji (67,9%) un 637,2 tūkstoši – lauku iedzīvotāji. Rīgas iedzīvotāji (641,0 tūkstotis) bija 32,3% no kopējā valsts iedzīvotāju skaita, kas bija viens no augstākajiem rādītājiem Eiropā. Četrus gadus laikā iedzīvotāju skaits pilsētās samazinājās par 4,1%, laukos – par 4,6%.

Iedzīvotāju blīvums Latvijā 2015. gada sākumā bija 31 cilvēks uz 1 km² (2010. gadā – 33). Zemākais iedzīvotāju blīvums bija Rucavas un Rugāju novadā – 4 cilvēki uz 1 km². Visblīvāk apdzīvotas bija galvaspilsēta, republikas pilsētas un novadi Rīgas apkaimē. Tā, piemēram, iedzīvotāju blīvums uz 1 km² Rīgā bija 2 109 cilvēki, un Stopiņu novadā (pēc platības viens no mazākajiem novadiem – 53 km²) – 193 cilvēki uz 1 km² (skat. 1. karti.).

At the beginning of 2015, Latvia urban population accounted for 1 million 348.9 thousand (67.9%) and rural – 637.2 thousand. Riga residents (641.0 thousand) comprised 32.3% of the total population – one of the highest indicators in Europe. During the 4 years, number of population in urban areas has dropped by 4.1%, in rural areas – by 4.6%.

At the beginning of 2015, population density in Latvia constituted 31 persons per 1 km² (in 2010 – 33). The lowest population density was recorded in Rucava and Rugāji county – 4 persons per 1 km². Highest population density among all counties was recorded in Stopiņi (county with one of the smallest territories – 53 km²) – 193 persons per 1 km², and the highest population density was observed in cities under state jurisdiction – in Riga 2 109 persons per 1 km² (map 1).

Latvijas demogrāfiskās attīstības rādītāji 2005., 2010., 2013.–2014. gadā
Demography trends in Latvia; 2005, 2010, 2013–2014

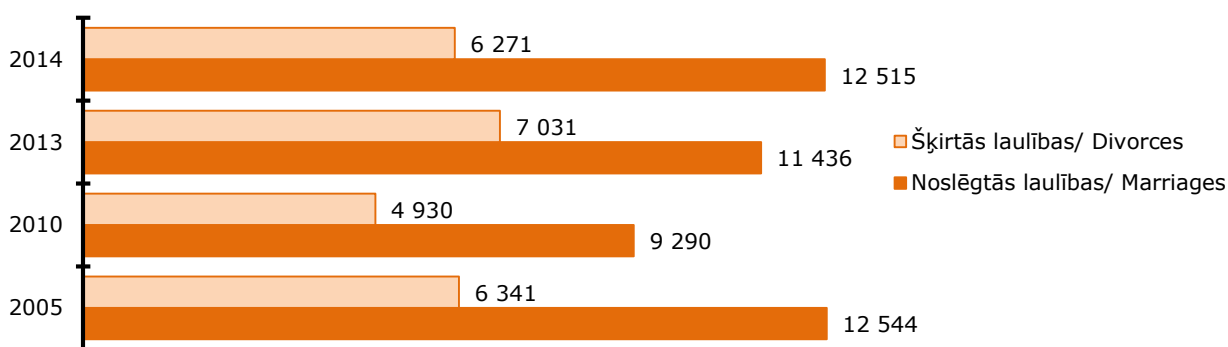

| | 2005 | 2010 | 2013 | 2014 | 2014. gadā pret 2013. gadu, procentos/ 2014 as per cent over 2013 | 2014. gadā uz 1 000 iedzīvotāju/ In 2014, per 1 000 population |
|---|--------|--------|--------|--------|--|---|

| Mirušo skaits/ <i>Number of deaths</i> | 32 777 | 30 040 | 28 691 | 28 466 | -0.8 | 14.3 |

Noslēgtās un šķirtās laulības

2014. gadā Latvijā tika noslēgtas 12 515 laulības, kas bija par 9,4% vairāk nekā 2013. gadā. Pagājušajā gadā tika šķirta 6 271 laulība. Salīdzinājumā ar 2013. gadu šķirto laulību skaits samazinājās gandrīz par 11%. Noslēgto laulību skaits uz 1 000 iedzīvotāju Latvijā bija 6,3 un šķirto laulību skaits – 3,1.

Marriages and divorces

In 2014, 12 515 marriages were concluded in Latvia – 9.4% more than in 2013; whereas 6 271 marriages were divorced. As compared to 2013, the number of divorces has reduced by almost 11%. Number of marriages per 1 000 population in Latvia comprised 6.3, while of divorces – 3.1.

Noslēgto un šķirto laulību skaits Latvijā 2005., 2010., 2013.–2014. gadā
Number of marriages and divorces in Latvia: 2005, 2010, 2013.–2014

Ar katru gadu samazinās laulību skaits jaunākās vecuma grupās. No 2014. gadā noslēgtajām laulībām 39% vīriešu un 52% sieviešu bija vecumā līdz 29 gadiem (2010. gadā – attiecīgi 47% un 60%, bet, piemēram, 2000. gadā – 60% un 68%, 1995. gadā – 68% un 74%). 4% vīriešu un 3% sieviešu noslēdza laulību 60 un vairāk gadu vecumā.

Latvieši 80% gadījumu noslēdza laulības ar savas tautības pārstāvi. Šis īpatsvars pēdējo desmit gadu laikā nav būtiski mainījies.

29% vīriešu un 28% sieviešu 2014. gadā noslēdza atkārtotu laulību. Joprojām lielākā daļa laulību tika noslēgtas dzimtsarakstu nodaļās – 2014. gadā 85%.

Augstākais noslēgto laulību rādītājs 2014. gadā bija Rīgas reģionā (6,8 laulības uz 1 000 iedzīvotāju), zemākais – Vidzemes reģionā (5,7).

Vidējais laulības ilgums 2014. gadā bija 14,4 gadi. 46% laulību šķīrušo vīriešu un 54% sieviešu bija vecumā līdz 39 gadiem.

The number of marriages concluded at young age is gradually diminishing. In 2014, 39% of men and 52% of women entered marriage before the age of 30 (in 2010 – 47% and 60%, while in 2000 – 60% and 68%, and in 1995 – 68% and 74%). 4% of males and 3% of females concluded marriage at age 60 or over.

80% of Latvians married person having the same nationality. The share has not changed notably during the last ten years.

29% of men and 28% of women in 2014 concluded marriage repeatedly. Still the greatest share of marriages is registered in civil registry offices – 85% in 2014.

The highest number of marriages per 1 000 population in 2014 was recorded in Riga region (6.8), while the lowest in Vidzeme region (5.7).

In 2014, the average duration of marriage comprised 14.4 years. 46% of divorced males and 54% of divorced females were aged less than 40.

Vidējais laulību noslēgušo personu vecums Latvijā 2005., 2010., 2013.–2014. gadā
Average age of persons marrying in Latvia: 2005, 2010, 2013.–2014

| Gads/ Year | Laulībā stājušos vidējais vecums/ <i>Average age of persons marrying</i> | | Pirmajā laulībā stājušos vidējais vecums/ <i>Mean age of persons marrying first time</i> | |
|---------------|---|------------------------------|---|------------------------------|
| | vīriešiem/ <i>males</i> | sievietēm/ <i>females</i> | vīriešiem/ <i>males</i> | sievietēm/ <i>females</i> |
| 2005 | 32.8 | 30.0 | 28.2 | 26.0 |
| 2010 | 34.1 | 31.4 | 29.4 | 27.4 |
| 2013 | 35.1 | 32.5 | 30.4 | 28.5 |
| 2014 | 35.8 | 33.1 | 30.8 | 28.9 |

Dzimstība

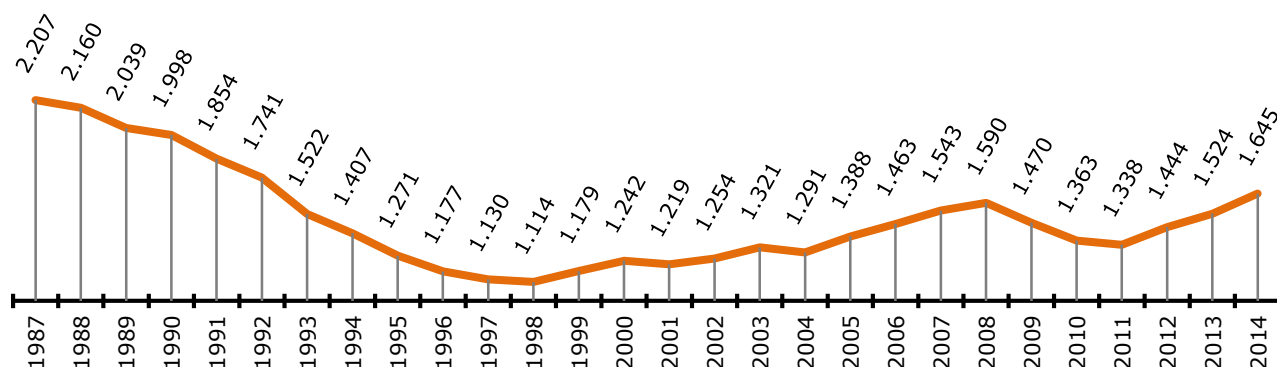

2014. gadā turpināja pieaugt dzīvi dzimušo skaits: piedzima 21,7 tūkstoši bērnu jeb par 1 150 bērniem vairāk nekā 2013. gadā. Dzimstības koeficients uz 1 000 iedzīvotāju bija 10,9. Jaundzimušā mātes vidējais vecums 2014. gadā bija 29,9 gadi, piedzimstot pirmajam bērnam – 27,2 gadi. Dzimstības pieaugums saistīts arī ar sieviešu skaita palielināšanos dzimstībai labvēlīgā vecumā. Tās ir sievietes, kuras dzimušas astoņdesmito gadu vidū, kad dzimstība bija visaugstākā. 2015. gada sākumā 15,8% no sievietēm reproduktīvajā (15–49 gadi) vecumā bija 25–29 gadus vecas sievietes (2005. gada sākumā – 13,1%, 2014. gada sākumā – 15,6%).

Paaudžu nomaigu raksturojošs rādītājs ir summārais dzimstības koeficients. 2014. gadā Latvijā tas pieauga līdz 1,65 (2013. gadā – 1,52), kas joprojām ir tālu no vēlamā bērnu skaita paaudžu nomaigai: 2,1–2,2. Lai paaudzes nomainītos normāli, dzimstībai jāpieaug daudz straujāk. Arī Eiropas Savienībā kopumā 2013. gadā summārais dzimstības koeficients bija tikai 1,55 (augstākais Francijā – 1,99). Pēdējo reizi summārā dzimstības koeficienta vērtība 2,2 Latvijā bija 1986.–1987. gadā, kad piedzima 42 tūkstoši bērnu gadā, kas bija lielākais dzimušo skaits kopš 1946. gada.

Fertility

Number of live births in 2014 continued to increase and comprised 21.7 thousand children or 1 150 children more than in 2013. Fertility rate per 1 000 population constituted 10.9. Average age of a newborn's mother in 2014 was 29.9 years, and age of mother at first childbearing comprised 27.2 years. Fertility increase is also related to the increase of the number of females at age favourable for giving birth. Those are females that were born in the middle of 1980ties when fertility rate was the highest. At the beginning of 2015, 15.8% of females at fertile age (15–49 years) were aged 25–29, as compared to 13.1% at the beginning of 2005 and 15.6% at the beginning of 2014.

Indicator characterising generational change is total fertility rate. In Latvia in 2014, this indicator grew to 1.65 (in 2013 – 1.52), nevertheless still is far away from the number necessary for the generational change, i.e., 2.1–2.2. For normal generational change birth number has to increase more rapidly. Fertility rate also in European Union as a whole comprised only 1.55 (highest in France – 1.99). Previous total fertility rate comprising 2.2 was recorded in 1986–1987, when in Latvia there was the highest birth number since 1946 – 42 thousand newborn during the year.

**Summārais dzimstības koeficients Latvijā 1987.–2014. gadā
Total fertility rate in Latvia; 1987–2014**

2014. gadā augstākie dzimstības rādītāji bija sievietēm 25–34 gadu vecumā – 61% bērnu piedzima sievietēm šajā vecuma grupā. 44% bērnu piedzima vecākiem, kas nav oficiāli reģistrējuši laulību. Pieauga otro un trešo bērnu skaits un arī viņu īpatsvars dzimušo kopskaitā.

The highest birth rates in 2014 were recorded for females aged 25–34 – 61% of children were born to mothers at this age. 44% of children were born to parents that have not registered their marriage officially. Also number of second and third children rose as did their share in the total number of newborn.

**Dzīvi dzimušie pēc dzimšanas secības Latvijā 2005., 2010., 2013.–2014. gadā
Live births in Latvia by order; 2005, 2010, 2013–2014**

| Gads Year | Dzimušo skaits/ Number of births | tai skaitā pēc dzimšanas secības/ of which by birth order | | | | procentos no dzimušo skaita/ as per cent of births | | | |
|--------------|-------------------------------------|--|-------------------|-------------------|---|---|-------------------|-------------------|---|
| | | pirmais/ first | otrais/ second | trešais/ third | ceturtais un vairāk/ fourth and higher order | pirmais/ first | otrais/ second | trešais/ third | ceturtais un vairāk/ fourth and higher order |
| 2005 | 21 879 | 11 263 | 6 963 | 2 351 | 1 302 | 51.5 | 31.8 | 10.8 | 5.9 |
| 2010 | 19 781 | 9 630 | 6 824 | 2 236 | 1 091 | 48.7 | 34.5 | 11.3 | 5.5 |
| 2013 | 20 596 | 9 191 | 7 649 | 2 662 | 1 094 | 44.6 | 37.1 | 12.9 | 5.4 |
| 2014 | 21 746 | 9 609 | 8 147 | 2 892 | 1 098 | 44.2 | 37.5 | 13.3 | 5.0 |

Augstākie dzimstības rādītāji 2014. gadā bija Pierīgas reģionā (12,0 dzimušie uz 1 000 iedzīvotāju) un Rīgā (11,7), zemākais – Latgales reģionā (8,6). Viens no iemesliem dzimstības rādītāju atšķirībai ir iedzīvotāju vecuma struktūra: Pierīgas reģionā no visām sievietēm

The highest birth rates in 2014 were recorded in Pierīga region (12.0 births per 1 000 population) and in Riga (11.7), while the lowest - in Latgale region (8.6). One of the reasons behind the differences in birth rates lies in the population structure – 44% of all females in

DEMOGRĀFISKĀ SITUĀCIJA LATVIJĀ/ DEMOGRAPHIC SITUATION IN LATVIA

fertilitātajā vecumā (15–49 gadi) 44% bija 20–34 gadus vecas, bet Latgales reģionā – 41%.

2014. gadā turpināja pieaugt vidējais mātes vecums, dzemdējot pirmo un otro bērnu. Piedzimstot pirmajam bērnam, tas bija 27,2 gadi, piedzimstot otrajam bērnam – 31 gads (savukārt 1990. gadā vidējais mātes vecums, piedzimstot pirmajam bērnam, bija 23,2 gadi, bet piedzimstot otrajam bērnam, tas bija gandrīz tāds pats kā dzimstot pirmajam bērnam mūsdienās – 27,0 gadi).

Lai gan kopumā valstī dabiskais pieaugums bija negatīvs, deviņos novados Pierīgas reģionā – Mārupes, Ķekavas, Siguldas, Ādažu, Babītes, Ikšķiles, Salaspils, Stopiņu un Garkalnes – tas bija pozitīvs (skat. 2. karti).

in fertility age (15–49 years) aged 20–34 are living in Pierīga region, while in Latgale region - only 41%.

In 2014 the average age of mother continues to increase when giving birth to first and second child. Giving the birth to first child it was 27,2 years and to second – 31 years (for comparison, in 1990 the average age of mother when giving birth to first child was 23,2 years but giving birth to second child it was almost the same as giving birth to first child today-27 years).

Nevertheless natural increase in the country as a whole was negative, in nine counties of Pierīga region - Mārupe, Ķekava, Sigulda, Ādaži, Babīte, Ikšķile, Salaspils, Stopiņi and Garkalne – it was positive (map 2).

Mirstība

Aizvadītajā gadā mirušo skaits bija 28,5 tūkstoši cilvēku un vispārīgais mirstības koeficients bija 14,3. Vidējais mirušo vīriešu vecums bija 68,2 gadi, sievietes – 78,7 gadi.

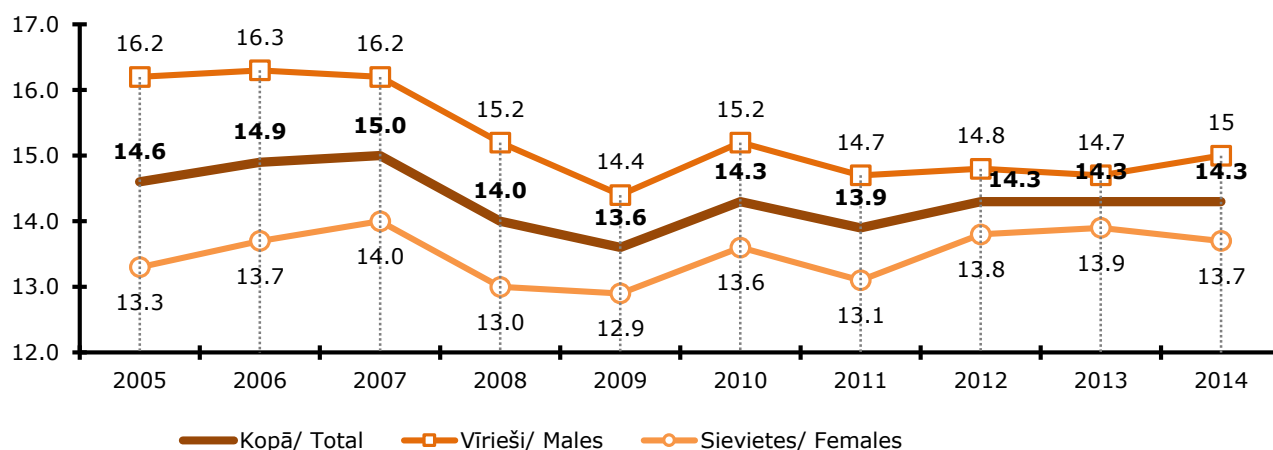

Mirstības rādītāji būtiski nesamazinās, jo pieauga iedzīvotāju skaits vecumā 70 un vairāk gadi – 2015. gada sākumā tie bija 282 tūkstoši (14,2% no iedzīvotāju kopskaita), bet 2010. gada sākumā – 270 tūkstoši (12,7%).

Mortality

Death number last year comprised 28.5 thousand persons, and crude death rate accounted for 14.3. Average age of males at death constituted 68.2 years, while of females – 78.7 years.

Death rates are not significantly lower, since the number of population aged 70 and over is increasing – at the beginning of 2015 those were 282 thousand people (14.2% of total population) while at the beginning of 2010 – 270 thousand persons (12.7%).

Mirušo skaits Latvijā 2005.–2014. gadā (uz 1 000 iedzīvotāju)
Number of deaths in Latvia in 2005–2014 (per 1 000 population)

Mirstības vispārīgais koeficients 2014. gadā visaugstākais bija Latgales reģionā (17,2 mirušie), zemākais – Pierīgas reģionā (12,1).

Demogrāfisko situāciju raksturojošs rezultāts rādītājs ir vidējais paredzamais mūža ilgums, un tas pakāpeniski pieaug. Pēdējos 19 gados zemākie jaundzimušo paredzamā mūža ilguma rādītāji bija 1994. gadā – 60,7 gadi vīriešiem un 72,9 gadi sievietēm. 2014. gadā dzimušo bērnu vidējais paredzamais mūža ilgums bija 74,6 gadi, vīriešiem – 69,3 gadi, sievietēm – 79,5 gadi. Mirstības un mūža ilguma tabulu aprēķini rādīja, ka, piemēram, vīriešu, kuri sasnieguši 60 gadu vecumu, vidējais turpmākās dzīves ilgums bija 17 gadi, bet šo pašu vecumu sasniegušajām sievietēm – 23 gadi.

Viens no svarīgākajiem demogrāfisko situāciju raksturojošajiem rādītājiem ir jaundzimušo mirstība pirmajā dzīves gadā, kas 2014. gadā turpināja samazināties. 2014. gadā Latvijā 83 bērni nomira, nerasniedzot viena gada vecumu (3,8 mirušie uz 1 000 dzīvi dzimušo). 2013. gadā nomira 91 bērns (4,4 mirušie uz 1 000 dzīvi dzimušo).

The highest crude death rate in 2014 was recorded in Latgale region (17.2 deaths), whereas the lowest - in Pierīga region (12.1).

Performance indicator characterising demographic situation is average life expectancy. Life expectancy is gradually growing. The lowest life expectancy of newborn within the last 18 years was recorded in 1994 - 60.7 years for men and 72.9 years for women. Average life expectancy of persons born in 2014 comprised 74.6 years – 69.3 for males and 79.5 years for females. Information in mortality and life expectancy tables shows that, e.g., average life expectancy (remaining years to be lived) of men aged 60 constitutes 17 years, while of women at the same age – 23 years.

One of the key indicators characterising demographic situation is infant mortality during their first year of life, which continued to decline in 2014. In 2014 in Latvia, 83 children died before reaching age of 1 (3.8 deaths per 1 000 live births). Respectively, 91 children died in 2013 (4.4 deaths per 1 000 births).

Iedzīvotāju dzimuma un vecuma sastāvs

Mirstības pārsvars pār dzimstību un iedzīvotāju emigrācijas pārsvars par imigrāciju Latvijā radīja izmaiņas arī iedzīvotāju vecumsastāvā. Jāatzīmē, ka kopš 2010. gada nedaudz pieaug bērnu un pusaudžu (0–14 gadi) īpatsvars iedzīvotāju kopskaitā, kas saistīts ar nelielu dzimstības pieaugumu, taču turpina samazināties darbības vecuma (15–61 gadi) iedzīvotāju, kā arī pieaug pensijas vecuma (62 un vairāk gadi) iedzīvotāju īpatsvars. Iedzīvotāju skaits darbības vecumā kopš 2010. gada sākuma samazinājies par 141 tūkstoši, bet vīrs darbības vecumā pieaudzis par 9 tūkstošiem.

Gender and age structure of population

Mortality prevalence over birth and negative net migration in Latvia caused also changes in age structure of Latvia population. It should be noted that since 2010, the share of children and youngsters (0–14 years) in the total population has slightly increased (that may be explained by a modest rise in the birth number); nevertheless the number of people at working age (15–61 years) is continuously reducing and the share of population at retirement age (62 years and over) is rising. The number of persons at working age since 2010 has dropped by 141 thousand, while the number of people over working age had gone up by 9 thousand.

Pastāvīgo iedzīvotāju skaits galvenajās vecuma grupās Latvijā 2005., 2010., 2014.–2015. gadā (gada sākumā)
Number of resident population in Latvia by main age groups; 2005, 2010, 2014–2015 (at the beginning of the year)

| Gads/ Year | Pavisam/ Total | tai skaitā/ of which | | | īpatsvars iedzīvotāju kopskaitā, procentos/ share in total population, per cent | | |
|---------------|-------------------|--|--|--|--|---|--|
| | | līdz darbības vecumam (0–14 gadi)/ under working age (0–14 years) | darbības vecumā (15–61 gads)/ at working age (15–61 year) | vīrs darbības vecuma (62 un vairāk gadi)/ over working age (62 years and over) | līdz darbības vecumam (0–14 gadi)/ under working age (0–14 years) | darbības vecumā (15–61 gads)/ at working age (15–61 year) | vīrs darbības vecuma (62 un vairāk gadi)/ over working age (62 years and over) |
| 2005 | 2 249 724 | 336 757 | 1 429 923 | 483 044 | 15.0 | 63.5 | 21.5 |
| 2010 | 2 120 504 | 300 294 | 1 372 691 | 447 519 | 14.2 | 64.7 | 21.1 |
| 2014 | 2 001 468 | 294 384 | 1 252 164 | 454 920 | 14.7 | 62.6 | 22.7 |
| 2015 | 1 986 096 | 297 720 | 1 237 739 | 456 637 | 15.0 | 62.0 | 23.0 |

Progresē iedzīvotāju novecošanās process. Darbības vecuma iedzīvotāju skaita samazinājumu būtiski ietekmē migrācija. 2014. gadā emigrēja divas reizes vairāk iedzīvotāju darbības vecumā (15,9 tūkst.), nekā imigrēja (8,0 tūkst.).

2015. gada sākumā 54,1% Latvijas iedzīvotāju bija sievietes. Vecumā līdz 36 gadiem vīriešu bija vairāk nekā sieviešu (arī dzimušo skaitā zēnu vienmēr ir vairāk nekā meiteņu). 2015. gada sākumā reproduktīvajā vecumā (15–49 gadi) vīriešu un sieviešu skaits bija līdzīgs – 49,3% vīriešu un 41,3% sieviešu.

Demogrāfiskās slodzes līmenis tiek lietots, analizējot proporcionālo sadalījumu starp tiem, kas ir darbības vecumā un ir vai varētu būt ekonomiski aktīvi, un pārējo sabiedrības daļu (bērniem un pensionāriem), kurus uztur iedzīvotāji darbības vecumā. Kopš 1993. gada pensijas vecuma iedzīvotāju īpatsvars ir lielāks par bērnu un pusaudžu īpatsvaru, kas nozīmē, ka nākotnē būs mazāks iedzīvotāju skaits darbības vecumā un demogrāfiskās slodzes līmenis pieaugs. 2015. gada sākumā uz 1 000 darbības vecuma iedzīvotāju bija 371 pensijas vecuma iedzīvotājs un 242 bērni vecumā līdz 14 gadiem.

Latvijas iedzīvotāju vidējais vecums 2015. gada sākumā bija 42,5 gadi, tai skaitā 39,2 gadi vīriešiem un 45,3 gadi sievietēm (salīdzinājumam: 2010. gada sākumā attiecīgi 41,2, 38,1 un 43,9). Vidējais iedzīvotāju vecums ir mazāks Pierīgas reģionā (40,9 gadi), lielāks – Latgalē (44,0 gadi).

Augstāks bērnu īpatsvars (vecumā līdz 14 gadiem) visu iedzīvotāju kopskaitā bija Pierīgas reģionā (17,0%), bet zemākais rādītājs – Latgales reģionā (13,4%). Pensijas vecuma iedzīvotāju īpatsvars augstāks bija Latgales (24,5%), bet zemākais rādītājs bija Pierīgas reģionā (20,9%).

Darbības vecuma iedzīvotāju īpatsvars 2015. gada sākumā valsts reģionos svārstījās no 61,0% Kurzemes reģionā līdz 62,6% Zemgales reģionā.

Population ageing is intensifying. Drop in the population at working age is notably affected by the migration. In 2014, 2 times more people at working age emigrated from the country (15.9 thsd), as compared to the immigrant number at this age (8.0 thsd).

At the beginning of 2015, females comprised 54.1% of Latvia residents. At age under 37 there are more males (also number of newborn boys exceeds the number of newborn girls). At the beginning of 2015 49.3% of men and 41.3% of women in this ages.

Demographic burden is used to analyse proportion between the people at working age, population active or might be active and the rest part of the society (children and pensioners) receiving benefits and allowances paid from the taxes paid by the population at working age. Since 1993, the share of people at retirement age exceeds the share of children and young people, and it means that in future the number of population at working age will be smaller and the level of demographic burden will increase. At the beginning of 2015, per 1 000 population at working age there were 371 persons at retirement age and 242 children aged less than 15.

Average age of Latvia population at the beginning of 2015 constituted 42.5 year – 39.2 years for males and 45.3 years for females (in comparison: at the beginning of 2010 – 41.2, 38.1 and 43.9, respectively). In terms of mean population age, Pierīga region is the youngest (40.9), while Latgale – the oldest (44.0).

The highest share of children (aged under 15) was recorded in the total population of Pierīga region (17.0%), while the lowest – in Latgale region (13.4%). In its turn, Latgale region indicate the largest share of population at retirement age (24.5%), whereas Pierīga region – the smallest (20.9%).

At the beginning of 2015, the share of population at working age in regions varied between 61.0% in Kurzeme and 62.6% in Zemgale.

Iedzīvotāju etniskais sastāvs un valstiskā piederība

Latviešu skaits pēdējos gados aizvien turpina samazināties, taču vienlaikus palielinās viņu īpatsvars kopējā iedzīvotāju skaitā. 2015. gada sākumā Latvijā dzīvoja 1 miljons 224 tūkstoši latviešu. Pēdējo piecu gadu laikā kopš 2010. gada piedzima 68,4 tūkstoši, bet nomira 79,5 tūkstoši latviešu, un dabiskās kustības rezultātā to skaits samazinājās par 11,1 tūkstoši.

2014. gadā piedzima par 240 latviešiem vairāk nekā nomira un 73% no dzimušo kopskaita bija latvieši.

Būtiski atšķiras iedzīvotāju etniskais sastāvs reģionos un republikas pilsētās. 2015. gada sākumā Rīgā, Daugavpilī un Rēzeknē latvieši bija mazāk par pusi no pilsētas iedzīvotāju kopskaita, turklāt Daugavpilī tie bija tikai 19,2%. Lielākais latviešu īpatsvars bija Valmierā – 83,4%. No reģioniem lielākais latviešu īpatsvars bija Vidzemes reģionā (86,5%), bet mazākais – Latgales reģionā (45,5%).

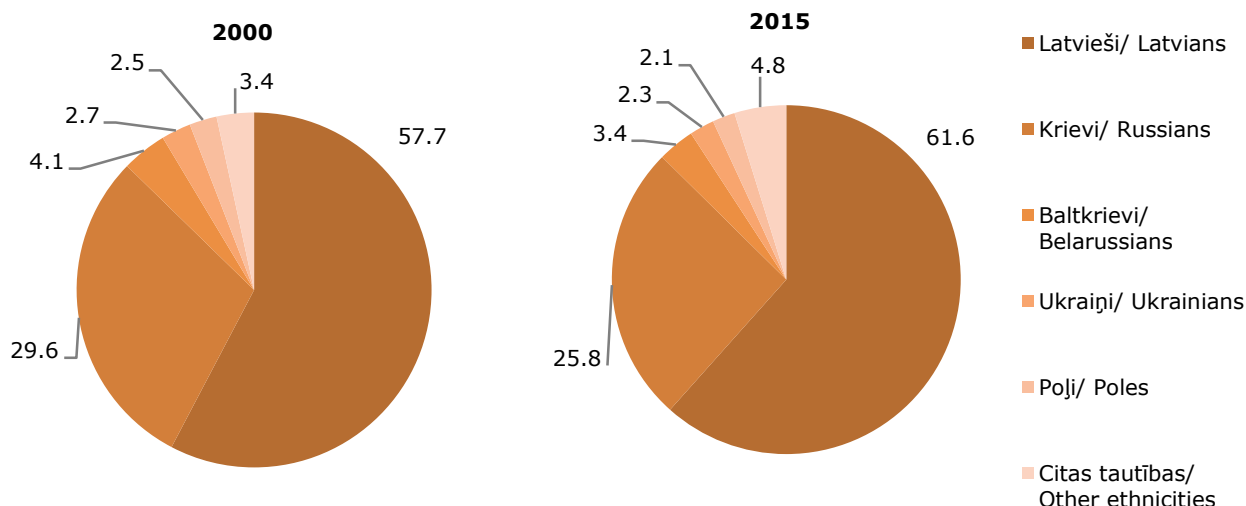

Population ethnic composition and citizenship

During the last years, number of Latvians is continuously reducing; meanwhile their share in the total population is increasing. At the beginning of 2015, Latvia was resided by 1 million 224 thousand Latvians. During the last five years since 2010, 68.4 thousand Latvians born and 79.5 thousand Latvians died; due to natural movement their number has diminished by 11.1 thousand.

In 2014, Latvians accounted for 73% of the total newborn number.

Notable differences in the population ethnic composition may be observed among regions and cities under state jurisdiction. At the beginning of 2015, in Riga, Daugavpils and Rēzekne Latvians accounted for less than a half of the population; moreover in Daugavpils the share comprised only 19.2%. The highest share of Latvians was recorded in Valmiera city 83.4% and Vidzeme region (86.5%), whereas the lowest – in Latgale region (45.5%).

Latvijas iedzīvotāju etniskais sastāvs 2000. un 2015. gada sākumā (procentos)
Ethnic composition of Latvia population at the beginning of 2000 and 2015 (per cent)

Iedzīvotāju ģimenes stāvoklis

2015. gada sākumā 40,7% pilngadīgo sieviešu un 49,1% vīriešu bija precēti. No visiem attiecīgā dzimuma neprecētajiem pilngadīgajiem iedzīvotājiem 53% vīriešu un 50% sieviešu bija vecumā līdz 30 gadiem. Iedzīvotāju grupējumu pēc ģimenes stāvokļa būtiski ietekmē tas, ka sieviešu īpatsvars ir lielāks, kā arī, kā jau iepriekš minēts, sieviešu paredzamais mūža ilgums ir garāks un vīriešu mirstība ir augstāka. Tā rezultātā sieviešu atraitņu ir gandrīz sešas reizes vairāk nekā vīriešu atraitņu. Iedzīvotāju ģimenes stāvoklis administratīvajās teritorijās attēlots 4. kartē.

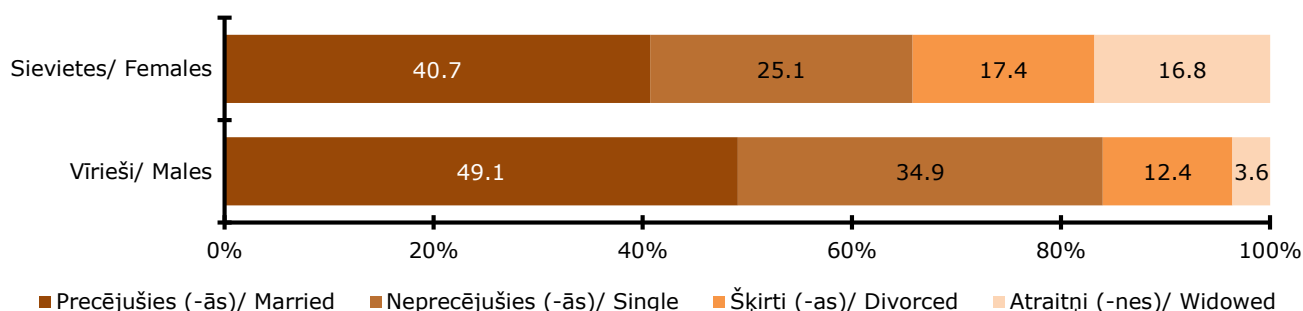

Laulību statistikas dati par 2014. gadu rāda, ka vīrieši pirmoreiz laulību reģistrēja vidēji 30,8 gadu, bet sievietes – 28,9 gadu vecumā.

Marital status of population

At the beginning of 2015, 40.7% of adults females and 49.1% of males were married. Out of all unmarried adults 53% of males and 50% of females were aged less than 30. Population breakdown by marital status is significantly influenced by the facts that female share is greater and life expectancy of women is higher than one of males, moreover men mortality is higher. As a result, there are almost six times more widowed women, as compared to widowed men. Population by marital status in administrative territories is showed in map 4.

Statistics indicates that, in 2014, males registered their first marriage at age of 30.8, while females – at age of 28.9.

 (vecumā 18 gadi un vecāki/ aged 18 years and over)

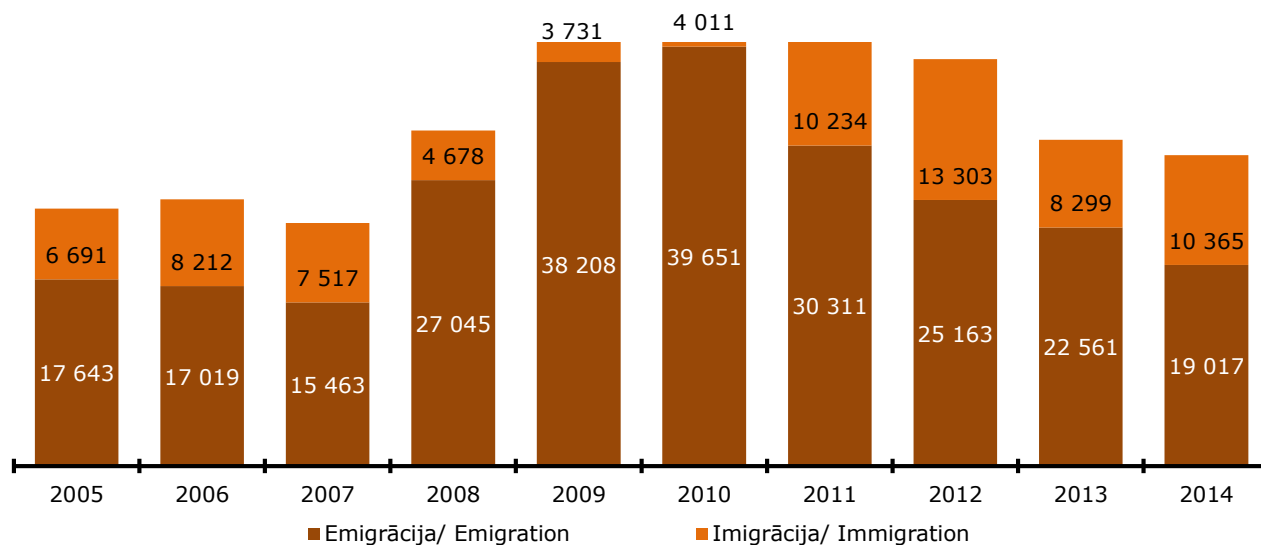

Iedzīvotāju ilgtermiņa migrācija

2014. gadā Latvijā uz dzīvi ieradās 10 365 cilvēki (par 25% vairāk nekā 2013. gadā), bet uz pastāvīgu dzīvi citās valstīs devās 19 017 cilvēks (par 16% mazāk nekā 2013. gadā). 2014. gadā Latvijā starptautiskās iedzīvotāju ilgtermiņa migrācijas rezultātā iedzīvotāju skaits samazinājās par 8 652 cilvēkiem salīdzinājumā ar 14 262 cilvēkiem 2013. gadā.

Population long-term migration

In 2014, 10 365 persons arrived to Latvia for permanent residence (25% more than in 2013), while 19 017 persons left the country for permanent residence in other countries (16% less than in 2013). In 2014, population number in Latvia due to international long-term migration dropped by 8 652, as compared to 14 262 persons in 2013.

Iedzīvotāju starptautiskā ilgtermiņa migrācija 2005.–2014. gadā (skaits)
International long-term migration; 2005-2014 (persons)

Satraucošs ir fakts, ka uz ārvalstīm devās liels skaits valsts iedzīvotāju darbaspējas vecumā (83,4% no emigrējušo skaita). Vecuma grupā no 15 līdz 29 gadiem 2014. gadā emigrēja 6,9 tūkstoši iedzīvotāju.

Alarming is a fact that people at working age have left the country (83.4% of emigrant number). In 2014, 6.9 thousand young people belonging to the age group 15–29 years emigrated from the country.

Iedzīvotāju starptautiskā ilgtermiņa migrācija 2014. gadā pēc migrantu vecuma
International long-term migration in 2014 by age of migrants

| Gads/ Year | Pavisam/ Total | tai skaitā/ of which | | | īpatsvars imigrantu/emigrantu kopskaitā, procentos/ share in total immigrant/emigrant number, per cent | | |
|----------------------------|-------------------|--|---|--|--|---|--|
| | | līdz darbspējas vecumam (0–14 gadi)/ under working age (0–14 years) | darbspējas vecumā (15–61 gads)/ at working age (15–61 year) | virs darbspējas vecuma (62 un vairāk gadi)/ over working age (62 years and over) | līdz darbspējas vecumam (0–14 gadi)/ under working age (0–14 years) | darbspējas vecumā (15–61 gads)/ at working age (15–61 year) | virs darbspējas vecuma (62 un vairāk gadi)/ over working age (62 years and over) |
| Imigrācija/ Immigration | 10 365 | 1 718 | 8 029 | 618 | 16.6 | 77.5 | 5.9 |
| Emigrācija/ Emigration | 19 017 | 2 391 | 15 865 | 761 | 12.6 | 83.4 | 4.0 |

No kopējā imigrantu skaita 3,9 tūkstoši jeb 37,5% bija latvieši un 3,2 tūkstoši jeb 30,8% – krievi, savukārt no emigrantiem 9,7 tūkstoši jeb 50,8% bija latvieši un 5,7 tūkstoši jeb 30,1% – krievi. Tomēr, skatot pret attiecīgās tautības iedzīvotāju kopskaitu 2015. gada sākumā, latviešu emigranti veidoja 0,8% no kopējā latviešu skaita, bet krievu tautības emigranti – 1,1%.

3.9 thousand persons or 37.5% of the total immigrant number were Latvians and 3.2 thousand or 30.8% were Russians, while in emigrant number Latvians comprised 9.7 thousand or 50.8% and Russians – 5.7 thousand or 30.1%. Nevertheless analysis of the total corresponding ethnicity population at the beginning of 2015 indicates that Latvian emigrants accounted for 0.8% of the total Latvian number and Russian emigrants comprised 1.1%.

International long-term migration in 2014 by migrant ethnicity

| Gads/Year | Pavisam/ Total | tai skaitā/ of which | | | īpatsvars imigrantu/emigrantu kopskaitā, procentos/ share in total immigrant/emigrant number | | |
|----------------------------|-------------------|-----------------------|---------------------|---|--|---------------------|---|
| | | latvieši/ Latvians | krievi/ Russians | citas tautības/ other ethnicities | latvieši/ Latvians | krievi/ Russians | citas tautības/ other ethnicities |
| Imigrācija/ Immigration | 10 365 | 3 882 | 3 191 | 3 292 | 37.4 | 30.8 | 31.8 |
| Emigrācija/ Emigration | 19 017 | 9 655 | 5 722 | 3 640 | 50.8 | 30.1 | 19.8 |

No kopējā iedzīvotāju skaita, kuri ieradās Latvijā 2014. gadā, 38% bija sievietes un 62% vīrieši. Gandrīz puse no iebraucējiem bija vecumā no 20 līdz 39 gadiem (42% vīriešu un 44% sieviešu bija šajā vecumā). No kopējā imigrantu skaita 77% bija darbspējas vecumā (15–61 gads).

Kopējā emigrantu skaitā 2014. gadā vīriešu un sieviešu īpatsvars ir gandrīz vienāds – attiecīgi 51% un 49%. Vairāk nekā puse emigrējušo iedzīvotāju ir vecumā no 20 līdz 39 gadiem (55% vīriešu un 53% sieviešu). Lielākā daļa (71%) no emigrējušām sievietēm bija reproduktīvajā vecumā (15–49 gadi).

Skatot starptautisko ilgtermiņa migrāciju sadalījumā pa valstu grupām, atbilstoši CSP novērtējumam 55,9% no 2014. gada imigrantiem bija no Eiropas Savienības valstīm (lielākā daļa no Apvienotās Karalistes, Īrijas, Vācijas). Būtisku daļu (20%) veidoja imigranti no Krievijas.

76% no 2014. gada emigrantiem devās uz Eiropas Savienības valstīm (lielākā daļa uz Apvienoto Karalisti, Vāciju, Īriju un Nīderlandi).

Out of the total number of people arriving to Latvia in 2014 females accounted for 38% and males for 62%. About a half of the immigrants were aged 20–39 (42% of men and 44% of women). 77% of the total immigrant numbers were at working age (15–61 years).

In 2014, shares of males and females in the total emigrant number are almost equal – 51% and 49%, respectively. More than a half of emigrants are aged 20–39 (55% of men and 53% of women). Most part (71%) of the emigrants-females was at childbearing age (15–49 years).

Analysis of international long-term migration in breakdown by country group shows that, according to the CSB estimates, 55.9% of the persons immigrating in 2014 came from EU countries (most from UK, Ireland, Germany). Notable part (20%) was formed by immigrants coming from Russian Federation.

76% of people emigrating from Latvia in 2014 went to EU Member States (most part to the United Kingdom, Germany, Ireland and the Netherlands).

METODOLOĢIJA UN TERMINU SKAIDROJUMI

Sākotnējās demogrāfiskās statistikas informācijas iegūšanas avoti ir:

- ◆ civilstāvokļa aktu reģistri, kas tiek sastādīti pilsētu un novadu dzimtsarakstu nodaļās un reģistrēti Civilstāvokļu aktu reģistrācijas informācijas sistēmā (CARIS);
- ◆ administratīvais Iedzīvotāju reģistrs, uz kura datu pamata tiek izstrādāta un publicēta informācija par iedzīvotāju skaitu, vecumsastāvu, tautību, valstisko piederību, migrāciju u.c.;
- ◆ Slimību profilakses un kontroles centra dati par nāves cēloni;
- ◆ Valsts zemes dienesta dati par platībām;
- ◆ citi datu avoti.

Informācijas iegūšanas metode ir pilns apsekojums. Tas nozīmē, ka demogrāfiskās statistikas datu iegūšanā netiek izmantota izlases metode. Datu vākšana pilna apsekojuma formā ļauj iegūtus datus publicēt par katru valsts administratīvo teritoriju, kas nav iespējams, ja datu iegūšanai tiek lietota izlases metode.

Iedzīvotāju skaita aprēķins (sākot ar 2012. gadu) – CSP ir izstrādājusi jaunu metodi iedzīvotāju skaita aprēķināšanai, kas balstās uz statistisko klasifikāciju. Statistiskās klasifikācijas mērķis ir sadalīt Latvijas Iedzīvotāju reģistrā reģistrētos iedzīvotājus divās klasēs (grupās) – faktiski dzīvo Latvijā (Latvijas pastāvīgie iedzīvotāji) vai faktiski dzīvo ārzemēs. Statistiskās klasifikācijas modelis ir izveidots, izmantojot loģistiskās regresijas analīzi. Analīzei tiek izmantoti 2011. gada tautas skaitīšanas un LR Centrālajai statistikas pārvaldei pieejamo administratīvo reģistru individuālie dati, sākot ar 2010. gadu. Detalizēts metodoloģijas apraksts ir pieejams CSP mājaslapā www.csb.gov.lv.

Starptautiskās ilgtermiņa migrācijas plūsmas novērtētas, izmantojot citu valstu statistiku par imigrantiem no Latvijas (spoguļstatistika), reģistrētās migrācijas tendences, kā arī 2011. gada tautas skaitīšanas apkopoto informāciju par migrāciju. Detalizēti starptautiskās ilgtermiņa migrācijas plūsmas novērtētas, izmantojot iepriekš minēto modeli.

Demogrāfiskie koeficienti (dzimstības, mirstības, noslēgto un šķirto laulību vispārīgie koeficienti) tiek rēķināti uz 1 000 attiecīgā gada vidējiem iedzīvotāju. Ja ir mazi absolūtie rādītāji, koeficienti var tikt rēķināti uz 10 000 vai uz 100 000 iedzīvotāju.

Atsevišķos gadījumos sakarā ar datu elektroniskās apstrādes tehnoloģijas specifiku uz skaitļu noapaļošanas rēķina iespējamās nelielas atšķirības starp uzrādīto kopējo apjomu un saskaitāmo kopsummu.

* * *

Aborts - grūtniecības pārtraukšana vai izbeigšanās pirms pilnām 22 grūtniecības nedēļām.

Atražošanās bruto koeficients - vidējais meiteņu skaits, kas varētu piedzimt vienai sievietei reproduktīvajā vecumā, pastāvot attiecīgā perioda dzimstības līmenim.

Atražošanās neto koeficients - vidējais meiteņu skaits, kas varētu piedzimt vienai sievietei un nodzīvot līdz vidējam mātes vecumam, pastāvot attiecīgā perioda dzimstības un mirstības līmenim. Koeficients 1,0 nozīmē, ka katrā sievietē paaudzē ir tieši tik meitu, lai aizvietotu sevi iedzīvotāju skaitā.

Bezvalstnieks - persona bez pilsonības (pavalstniecības).

Civilstāvokļa aktu reģistri - laulību noslēgšanas, dzimšanas un miršanas gadījumu reģistrēšanas pirmdokumenti dzimtsarakstu nodaļās.

Demogrāfiskā slodze - darbības vecumu nesasnējušo un pārsniegušo personu skaits vidēji uz 1 000 personu darbības vecumā.

Dzimstības vecumkoeficients - vidējais dzimstības līmenis sievietēm konkrētā vecumā. Koeficients tiek aprēķināts, attiecinoši gada laikā dzimušo bērnu skaitu sievietēm attiecīgajā vecuma grupā pret gada vidējo šīs pašas vecuma grupas sievietņu skaitu. Aprēķinot speciālo dzimstības koeficientu vecuma grupai līdz 19 gadiem, saucējā tiek ņemts gada vidējais sievietņu skaits 15–19 gadu vecumā. Aprēķinot dzimstības koeficientu vecuma grupai 15–49 gadi, dzimušo bērnu skaitā ir iekļauti bērni, kuri dzimuši sievietēm līdz 14 gadiem, kā arī 50 gadu un vecākām. Parasti aprēķina uz 1 000 sievietņu.

Dzimstības vispārīgais koeficients - noteiktā laikā dzīvi dzimušo bērnu skaita attiecība pret vidējo iedzīvotāju skaitu noteiktā teritorijā. Parasti aprēķina par vienu kalendāro gadu uz 1 000 iedzīvotāju.

Dzimšanas secība - jaundzimušā bērna kārtas skaitlis attiecībā pret visiem iepriekšējiem mātei dzīvi dzimušajiem bērniem; tas ir, iepriekšējais dzīvi dzimušo bērnu skaits plus jaundzimušais.

Dzimšanas vai miršanas vieta - noteikta administratīvā teritorija: republikas vai novada pilsēta, novads. Kā bērna dzimšanas vieta statistiskajās tabulās parasti tiek parādīta viņa dzīvesvieta.

Dzīvi dzimušais - auglis, kurš ir atdalīts no mātes organisma un ir parādījis dzīvības pazīmes. Latvijā kopš 1991. gada tiek lietota dzīvi dzimušā definīcija, kas atbilst Pasaules Veselības Organizācijas rekomendācijām.

Emigrants (ilgtermiņa) - persona, kura izbrauc uz citu valsti (starptautiskais emigrants) vai uz citu Latvijas administratīvo teritoriju pastāvīgās dzīvesvietas maiņas nolūkā vai vismaz uz vienu gadu.

Emigrants (īstermiņa) - persona, kura izbrauc uz citu valsti uz laiku, kas ir vienāds vai lielāks par 3 mēnešiem, bet mazāks par vienu gadu.

Fertilais (reproduktīvais) **vecums** - vecums, kurā sieviete bioloģiski spēj dzemdēt bērnus, parasti 15–49 gadi.

Gada vidējais iedzīvotāju skaits - vidējais iedzīvotāju skaits kalendārā gada laikā, kas parasti tiek rēķināts kā aritmētiskais vidējais no iedzīvotāju skaita 1.janvārī diviem sekojošiem gadiem.

Ģimenes stāvoklis - personas individuālais statuss attiecībā pret ģimeni atbilstoši valsts likumdošanai. Parasti tiek lietotas četras standartkategorijas: neprecējies/-usies, precējies/-usies, šķirts/-ta, atraitis/-ne. Dati tiek sagatavoti atbilstoši ierakstiem Iedzīvotāju reģistrā.

Iedzīvotāju blīvums - noteiktas teritorijas apdzīvotības biežums, ko parasti izsaka kā vidējo iedzīvotāju skaitu uz 1 km².

Iedzīvotāju dabiskais pieaugums - starpība starp noteiktā laika periodā dzimušo un mirušo skaitu.

Iedzīvotāju dabiskā pieauguma koeficients - iedzīvotāju dabiskā pieauguma (samazinājuma) attiecība pret gada vidējo iedzīvotāju skaitu. Parasti aprēķina uz 1 000 iedzīvotāju.

Iedzīvotāju ilgtermiņa migrācija - iedzīvotāju pārvietošanās no vienas administratīvās teritorijas uz citu pastāvīgās dzīvesvietas maiņas nolūkā vai vismaz uz vienu gadu. Migrāciju iedala ārējā (starptautiskajā) un iekšējā (Latvijas ietvaros). Migrācija pilsētu un novadu griezumā ietver arī pārvietošanos valsts robežās starp dažādām administratīvajām teritorijām. Taču, ja persona maina dzīvesvietu vienas pilsētas vai novada robežās, tā, atbilstoši starptautisko organizāciju rekomendācijām, migrācijas statistikā netiek uzskaitīta.

Iedzīvotāju migrācijas pieauguma/samazinājuma koeficients - iedzīvotāju migrācijas saldo (starpība starp imigrantu un emigrantu skaitu) attiecība pret vidējo iedzīvotāju skaitu noteiktā teritorijā. Parasti aprēķina par vienu kalendāro gadu uz 1 000 iedzīvotāju.

Iedzīvotāju skaita izmaiņas - starpība starp iedzīvotāju skaitu perioda beigās un sākumā. Izmaiņas ir vienādas ar algebrisko summu starp dabisko pieaugumu un migrācijas saldo (iekļaujot korekcijas). Izmaiņas ir ar mīnus zīmi, ja abi šie komponenti ir ar mīnus zīmi, vai kad viens ir ar mīnus zīmi un tā absolūtā vērtība ir lielāka nekā otram.

Iedzīvotāju vecuma piramīda - iedzīvotāju dzimuma un vecuma sadalījums grafiskā veidā ar vienāda mēroga horizontālām joslām. Informācija par vīriešiem un sievietēm tiek attēlota pretējos virzienos.

Imigrants (ilgtermiņa) - persona, kura ierodas dotajā administratīvajā teritorijā no citas valsts (starptautiskais imigrants) vai no citas Latvijas administratīvās teritorijas, lai apmestos uz pastāvīgu dzīvi vai vismaz uz vienu gadu.

Imigrants (īstermiņa) - persona, kura ierodas dotajā administratīvajā teritorijā no citas valsts uz laiku, kas ir vienāds vai lielāks par 3 mēnešiem, bet mazāks par vienu gadu.

Jaundzimušo vidējais paredzamais mūža ilgums - gadu skaits, ko vidēji nodzīvotu attiecīgajā gadā dzimušie, ja viņu turpmākās dzīves laikā mirstības līmenis katrā vecumā paliktu tāds pats, kāds tas bija dzimšanas gadā. Datus iegūst no *mirstības un vidējā paredzamā mūža ilguma* tabulām.

Laulātības vispārīgais koeficients - noslēgto laulību skaita attiecība pret vidējo iedzīvotāju skaitu. Parasti aprēķina par vienu kalendāro gadu uz 1 000 iedzīvotāju.

Laulības šķiršana - valsts likumos paredzētajā kārtībā spēkā stājies lēmums par laulību šķiršanu; process, kura rezultāts ir laulības izbeigšana. Sākot ar 2011. gada 1. februāri, laulības šķiršanu Latvijā var veikt arī zvērināts notārs.

Laulību šķiršanas vispārīgais koeficients - noteiktā laikā šķirto laulību skaita attiecība pret vidējo iedzīvotāju skaitu. Parasti aprēķina par vienu kalendāro gadu uz 1 000 iedzīvotāju.

Migrācijas saldo (ilgtermiņa) - starpība starp konkrētajā administratīvajā teritorijā uz pastāvīgu dzīvi ieradušos un no tās uz citām pastāvīgās dzīves vietām izbraukušo iedzīvotāju skaitu noteiktā laika periodā.

Migrants (ilgtermiņa) - persona, kura maina pastāvīgās dzīves vietu no vienas administratīvās teritorijas (valsts) uz citu. Saskaņā ar ANO Rekomendācijām un Eiropas Parlamenta un Padomes Regulu (EK) Nr. 862/2007 (2007. gada 11. jūlijs) par Kopienas statistiku attiecībā uz migrāciju un starptautisko aizsardzību, par **ilgtermiņa starptautiskajiem migrantiem** statistikā tiek uzskaitītas personas, kuras ierodas valstī, lai paliktu te uz pastāvīgu dzīvi vai uz laiku, kas vienāds vai ilgāks par vienu gadu, kā arī personas, kas izbrauc no vienas valsts uz citu valsti ar nolūku uzturēties tur pastāvīgi vai vienu gadu un ilgāk. Šis uzturēšanās ilguma kritērijs ļauj nošķirt ilgtermiņa migrantus no citām valsts robežu šķērsojošajām personu grupām - tūristiem, ekskursantiem, īstermiņa migrantiem.

Mirstības un mūža ilguma tabulas - savstarpēji saistītu rādītāju sistēma noteikta vecuma iedzīvotāju mirstības un izdzīvošanas raksturošanai, sagaidāmā mūža ilguma un citu rādītāju aprēķināšanai.

Mirstības vecumkoeficients - vidējais mirstības līmenis noteiktā iedzīvotāju vecuma grupā. Koeficients tiek aprēķināts, attiecinot gada laikā mirušo skaitu attiecīgajā vecuma grupā pret gada vidējo šīs pašas vecuma grupas iedzīvotāju skaitu. Parasti aprēķina uz 1 000 iedzīvotāju.

Mirstības vispārīgais koeficients - noteiktā laikā mirušo skaita attiecība pret vidējo iedzīvotāju skaitu noteiktā teritorijā. Parasti aprēķina par vienu kalendāro gadu uz 1 000 iedzīvotāju.

Nāves cēlonis - slimība, patoloģisks stāvoklis vai trauma, kas ir izraisījusi nāvi vai veicinājusi to, kā arī nelaimes gadījums vai vardarbības akts, kura rezultātā iestājusies nāve.

Sākot ar 1996. gadu, Latvijā iedzīvotāju mirstības cēloņu statistikā tiek lietota Pasaules Veselības Organizācijas izstrādātās Starptautiskās statistiskās slimību un veselības problēmu klasifikācijas 10. redakcija (SSK - 10). Informācijas avots par nāves cēloni ir Ārsta apliecība par nāves iestāšanos, norādot nāves cēloņus. Šī apliecība ir pamats nāves cēloņa ierakstīšanai miršanas reģistrā, kura otrais eksemplārs tiek lietots datu statistiskajā apstrādē. Statistikas vajadzībām patlaban tiek izmantots tikai viens - galvenais nāves cēlonis.

Nedzīvi dzimušais - auglis, kurš piedzimis nedzīvs pēc pilnām 22 grūtniecības nedēļām.

Neonatālā mirstība - zīdaiņu mirstība pirmajās četrās dzīves nedēļās.

Neonatālās mirstības koeficients - pirmajās četrās dzīves nedēļās mirušo skaita attiecība pret dzīvi dzimušo bērnu skaitu. Parasti aprēķina uz 1 000 dzīvi dzimušo.

Nepilsonis (Latvijas) - persona, kurai saskaņā ar likumu „Par to bijušās PSRS pilsoņu statusu, kuriem nav Latvijas vai citas valsts pilsonības” ir tiesības uz Latvijas Republikas izdotu nepilsoņa pasi.

Noslēgtās laulības - ietver laulības, kas noslēgtas gan pilsētu, novadu un pagastu dzimtsarakstu iestādēs, gan to konfesiju un draudžu baznīcās, kam atbilstoši Latvijas Republikas Civillikumam dotas tādas tiesības.

Pastāvīgie iedzīvotāji - iedzīvotāji, kuru pastāvīgā dzīvesvieta ir attiecīgā administratīvā teritorija. Iedzīvotāju iedalījums **pilsētu un lauku iedzīvotājos** tiek veidots pēc dzīvesvietas. Pilsētu iedzīvotāji ir personas, kas dzīvo pilsētās, t.i., apdzīvotajās vietās, kurās ir ne mazāk kā 2 000 pastāvīgo iedzīvotāju. Tiek pieļauts, ka atsevišķās vēsturiski izveidojušās pilsētās iedzīvotāju skaits var būt arī mazāks nekā 2 000 cilvēku. Pilsētas statusu piešķir un atceļ Saeima ar likumu. Visi pārējie ir lauku iedzīvotāji.

Pastāvīgā dzīvesvieta - saskaņā ar Eiropas Parlamenta un Padomes Regulu (EK) Nr. 1260/2013 vieta, kurā persona parasti pavada dienas atpūtas daļu, neņemot vērā īslaicīgu prombūtni. Par konkrētas teritorijas pastāvīgajiem iedzīvotājiem uzskata tikai personas, kuras pastāvīgajā dzīvesvietā ir dzīvojušas nepārtraukti vismaz 12 mēnešus vai ieradušās 12 mēnešu laikā pirms pārskata perioda ar nodomu tajā pavadīt vismaz vienu gadu.

Pastāvīgo iedzīvotāju galvenās vecuma grupas - galvenās vecuma grupas - līdz darbības vecumam, darbības vecumā un virs darbības vecuma - tiek noteiktas atbilstoši attiecīgo gadu Latvijas likumdošanā noteiktajam darbības vecumam un pensijas vecumam.

Darbspējas vecums, kas lietots iedzīvotāju vecuma struktūras tabulās 2015. gada 1. janvārī bija 15–61 gads, savukārt **pensijas vecums** - 62 un vairāk gadi.

Perinatālā mirstība - dzīvotspējīgu augļu vai jaundzimušo bērnu mirstība perinatālajā periodā (no pilnām 22 grūtniecības nedēļām līdz jaundzimušo pirmajām 7 dzīves dienām). Perinatālā mirstība ietver dzīvotspējīgu augļu mirstību pirms dzemdībām un to procesā (nedzīvi dzimušos), kā arī jaundzimušo mirstību pirmajā dzīves nedēļā.

Perinatālās mirstības koeficients - nedzīvi dzimušo un pirmajā dzīves nedēļā mirušo skaita attiecība pret dzīvi un nedzīvi dzimušo kopskaitu. Parasti aprēķina uz 1 000 dzimušo.

Pilsonis - persona, kura politiski un tiesiski ir piederīga noteiktai valstij.

Speciālais noslēgto (šķirto) laulību koeficients - vidējais laulību noslēgšanas (šķiršanas) līmenis vīriešiem un sievietēm pa vecuma grupām. Koeficients tiek aprēķināts, attiecinot gada laikā noslēgto (šķirto) laulību skaitu attiecīgās vecuma grupas iedzīvotājiem pret gada vidējo šīs pašas vecuma grupas iedzīvotāju skaitu.

Summārais dzimstības koeficients - vidējais bērnu skaits, kas varētu piedzimt vienai sievietei viņas dzīves laikā, ja dzimstība katrā vecumā saglabātos apskatāmā perioda līmenī. Summārais dzimstības koeficients tiek aprēķināts, summējot (viengadīgos vai 5 gadu) dzimstības vecumkoeficientus.

Summārais laulātības koeficients - vidējais laulību skaits attiecīgās paaudzes vīriešiem un sievietēm viņu dzīves laikā.

Valstiskā piederība (pilsonība) - personas tiesiskā piederība pie noteiktas valsts.

Vecums - iedzīvotāju nodzīvoto gadu skaits; parasti to uzskaita pilnos gados, zīdaiņiem - pilnos mēnešos, bet tiem, kuri jaunāki par 1 mēnesi - dienās.

Vidējais paredzamais mūža ilgums noteikta vecuma iedzīvotājiem - gadu skaits, kādu vidēji nodzīvotu attiecīgu vecumu sasniegušās personas, ja viņu turpmākās dzīves laikā mirstība katrā vecumā saglabātos aprēķina gada līmenī.

Zīdains - bērns, kurš vēl nav sasniedzis viena gada vecumu.

Zīdaiņu mirstība - dzīvi dzimušo bērnu mirstība pirmajā dzīves gadā. Tabulās par mirušo sadalījumu pēc vecuma mirušo vecums aprēķināts tikai pēc dzimšanas gada, līdz ar to mirušo skaits 0 gados atšķiras no zīdaiņu mirstības tabulās minētā mirušo skaita.

Zīdaiņu mirstības koeficients - mirušo zīdaiņu skaita attiecība pret kopējo dzīvi dzimušo skaitu noteiktā laika periodā. Parasti izsaka ar mirušo zīdaiņu skaitu uz 1 000 dzīvi dzimušo.

METHODOLOGY AND EXPLANATIONS OF TERMS

The sources of primary demographic statistical information are:

- ◆ Civil status registers drawn in civil registry offices of cities and counties and registered in civil registry information system (CARIS).
- ◆ Administrative Population Register, on the basis of which information on population number, age structure, ethnicity, citizenship, migration, etc., has been processed and published;
- ◆ Data on death causes managed by the Centre for Disease Prevention and Control of Latvia;
- ◆ State Land Service data on the areas;
- ◆ Other sources.

The method used to obtain the information is a full-scope survey. It means that sampling method is not used for acquiring demographic statistics. Collection of data with the help of a full-scope survey allows publishing statistics in breakdown by each administrative territory of our country; it is not possible when sampling method is used.

Calculation of the population number (starting from the beginning of 2012) – for calculation of the population number CSB has developed new method; it is based on statistical classification. The statistical classification aims at breaking down Latvia population registered with the Population Register into two classes (groups) – actually living in Latvia (resident population) or actually living abroad. Statistical classification model has been developed by using logistic regression analysis. The analysis is based on the data of the Population and Housing Census 2011 and individual data in administrative registers available to the Central Statistical Bureau of Latvia (CSB), starting from 2010. More detailed methodological description is available in the CSB webpage www.csb.gov.lv/en.

Flows of **international long-term migration** were estimated with the help of other country statistics on immigrants from Latvia (mirror statistics), trends of registered migration, as well as information on migration compiled within the framework of the Population and Housing Census 2011. More detailed estimates on international long-term migration flows are based on the abovementioned model.

Demographic rates (crude birth, death, marriage, and divorce rates) are calculated per 1 000 average population of the corresponding year. If absolute indicators are small, rates could be calculated per 10 000 or 100 000 population.

In some cases, due to specifics of electronic data processing technologies and rounding adjustments, slight discrepancies may occur between totals and sums of components.

* * *

Abortion - the termination of pregnancy less than 22 completed weeks of gestation.

Age - person's lifetime. It is usually counted in full years, for infants in full months, but for those under one month - in days.

Age-specific death rate - the mean level of mortality in a given age group of population. It is computed as a ratio of the annual number of deaths occurring at a given age during a year to the average annual number of persons at a given age. It is usually expressed per 1000 population.

Age-specific fertility rate - the average level of fertility of women in a definite age group. It is calculated as the quotient of the annual number of births to women in a given age group by the average annual number of women at this age.

Age-specific marriage (divorce) rate - the annual rate of contracted marriages (or divorces) for male and female population at each age group. It is calculated as the quotient of the annual number of contracted marriages (or divorces) in a given age group by the average annual number of population at this age.

Annual average number of population – arithmetical mean number of population during calendar year that usually is calculated as mean arithmetic of the population number on 1 January for the two following years.

Birth order - ranking of a new-born baby in relation to all previous live births of the mother; that is, the number of previous live births plus the birth which has just occurred.

Cause of death - a disease, pathological state or trauma that either resulted in or contributed to death as well as an accident or violence resulting in death.

Since 1996, the International Statistical Classification of Diseases and Related Health Problems, Tenth Revision (ICD-10) by the World Health Organisation is applied in mortality statistics in Latvia. The source of information on the cause of death is an inscription in medical death certificate. This certificate is the basis for indicating the cause of death in the legal death register, copy of which is used in data processing. One - the main cause of death is chosen for statistical purposes.

Citizen - a person politically and legally belonging to a definite state.

Citizenship - a person's legal affiliation to a definite state.

Civil status registers - original documents of marriage, birth and death registration in registry offices.

Crude birth rate - the ratio of the number of live births in a definite period of time to the average number of population in a given territory. It is usually expressed per 1 000 population.

Crude death rate - the ratio of the number of deaths in a definite period of time to the average number of population in a given territory. It is usually expressed per 1 000 population.

Crude divorce rate - number of divorces to the mean number of population in a definite time. It is usually expressed per one calendar year per 1 000 population.

Crude marriage rate - number of marriages to the mean number of population in a definite time. It is usually expressed per one calendar year per 1 000 population.

Demographic burden - population under and over working age per 1 000 population of working age.

Divorce - a marriage is regarded as divorced if the court ruling has become legally effective. Starting from 01.02.2011 marriage may be divorced by a sworn notary.

Emigrant (long-term) - a person who departs to another country (international emigrant) or another administrative territory of Latvia for permanent residence or for a period of at least a year.

Fertile (childbearing) age - the age at which a woman can give birth to child biologically, usually 15–49 years.

Gross reproduction rate (female) - the average number of daughters that would be born to a woman during her lifetime subject to a set of age-specific birth rates observed in the years for which the rate is computed.

Immigrant (long-term) - natural person who enters a given area from abroad (international immigrant) or from another administrative territory of Latvia for permanent residence or for a period of at least a year.

Infant - a child who has not reached its first birthday.

Infant mortality - mortality of live-born children during the first year of their life. In the tables showing the number of deaths by infant age the age has been calculated basing only on the birth year, thus number of deaths at age 0 differs from the number of deaths indicated in the mortality tables.

Infant mortality rate - a ratio of the number of deaths of children under one year of age to the number of live births in corresponding time period. The value is expressed per 1 000 live births.

Life expectancy at birth - the mean number of years an infant may expect to live if the mortality rates for each population group in the given year remained constant.

Life expectancy at a defined age - the mean number of years to be lived by the survivors to a definite age, provided that the mortality conditions remain the same as in the year when calculation was made.

Long-term migration - Long-term migration implies movements of the population from one administrative territory to another with an aim to change the place of residence permanently or for a period of at least a year. Migration is divided into external (international) and internal (within the territory of Latvia) migration. Breakdowns by city and county in the table on migration include internal migration between various administrative territories. However, if a person changes the place of residence within the boundaries of a town, pagast (civil parish) or county, according to the recommendations of international organizations, the migration movements of such a person are not counted.

Live birth - a foetus separated from a mother's organism and who has shown vitality features. In 1991 a new definition of live birth concept corresponding to the World Health Organisation recommendations was adopted in Latvia.

Main age groups of resident population - the main age groups of resident population - under working age, of working age and over working age - are defined in compliance with the working age and retirement age set by legislation of Latvia of the respective years.

As of 1 January 2015, men and women aged 15 - 61 constitutes **working age population** used in age structure tables. Men and women aged 62 and above are regarded as **population over working age**.

Marital status - Individual status of a person in relation to the family according to the national legislation. Four standard categories are used: single (unmarried), married, divorced, and widowed. Data are prepared according to records in Population Register.

Marriages - the number of marriages includes marriages contracted in the civil registry offices of cities/towns, counties and in the churches of the denomination parishes, which according to the Civil Law of Latvia have a right to register marriages.

Migrant (long-term) - a person who moves from permanent residence of one administrative territory (state) to another. According to Recommendations of the United Nations and Regulation (EC) No 862/2007 of the European Parliament and of the Council of 11 July 2007 on Community statistics on migration and international protection as **the long-term international migrants** are recorded persons arriving into the country for a permanent settlement or for a stay period at one year or more and persons departing from the given country to another with an aim to change the permanent place of residence or to stay in this destination country for one year or more. The criteria of time allow separating the long-term migrants from another flows of border crossing persons - tourists, excursionists, and short-term migrants.

Migration increase/decrease rate - the ratio of net migration (the difference between number of emigrants and immigrants) to the mean number of population in a given territory. It is usually expressed per one calendar year per 1 000 population.

Mortality (life) tables - a system of correlated indices to describe mortality and survival of population at given ages, to calculate indices of life expectancy and other ones.

Natural increase of population - difference between the number of births and the number of deaths in a given period of time.

Natural increase rate - a ratio of natural increase (decrease) of population to the mean number of population in a year. The value is expressed per 1 000 population.

Neonatal mortality - deaths of infants under 28 days of life.

Neonatal mortality rate - the ratio of the number of deaths under 28 days of age to the number of live births. Usually expressed per 1 000 live births.

Net migration (long-term) - difference between the total number of persons arriving in a country or definite administrative territory for permanent residence or for at least one year and the total number of persons departing from it to other administrative territory (country) for permanent residence or for at least one year.

Net reproduction rate (female) - the average number of daughters that would be born to a woman and live till the average age of mother if specific fertility and mortality rates of a given year would remain unchanged. A rate of 1.0 means each women generation is having exactly enough daughters to replace itself in the population.

Non-citizen (of Latvia) - a person who, in accordance with the Law On the Status of those Former U.S.S.R. Citizens who do not have the Citizenship of Latvia or that of any Other State, has the right to a non-citizen passport issued by the Republic of Latvia.

Perinatal mortality - mortality of viable foetuses and infants during the perinatal period (it is an interval from 22 completed weeks of gestation till the 7th day of infant's life). It includes viable foetuses' deaths before and in the process of deliveries (late foetal mortality) and infant deaths during the first week of life.

Perinatal mortality rate - a ratio of the number of stillbirths and deaths during the first week of life to the total number of live births and stillbirths. It is usually expressed per 1 000 births.

Place of birth or place of death - definite administrative territory: a city under state jurisdiction or a town, or a county. Newborn children in the statistical tables usually are reflected according to the place of their residence.

Population age pyramid - a graphical representation of the age and sex distribution of population with two horizontal bands of identical scale. Information on men and women is depicted in opposite directions.

Population change - the difference between the size of the population at the end and the beginning of a period. It is equal to the algebraic sum of natural increase and net migration (including corrections). There is negative change when born of these components are negative or when one is negative and has a higher absolute value than the other.

Population density - the density of population in a certain area usually expressed as the mean of inhabitants per 1 square kilometre.

Resident population - all inhabitants whose place of usual residence is the respective administrative territory. The distribution of the population by **urban and rural inhabitants** is made according to their place of residence. Urban population refers to those persons who live in cities and towns, i.e., in populated areas with at least 2 000 resident population. In a number of historically developed cities, the population may be less than 2 000. Status of a city and town is assigned and cancelled by the Saeima with law. All the rest is rural population.

Stateless person - a person who is not considered a citizen (national) in accordance with the laws of any state.

Stillbirth - a foetus born dead after full 22 weeks of gestation.

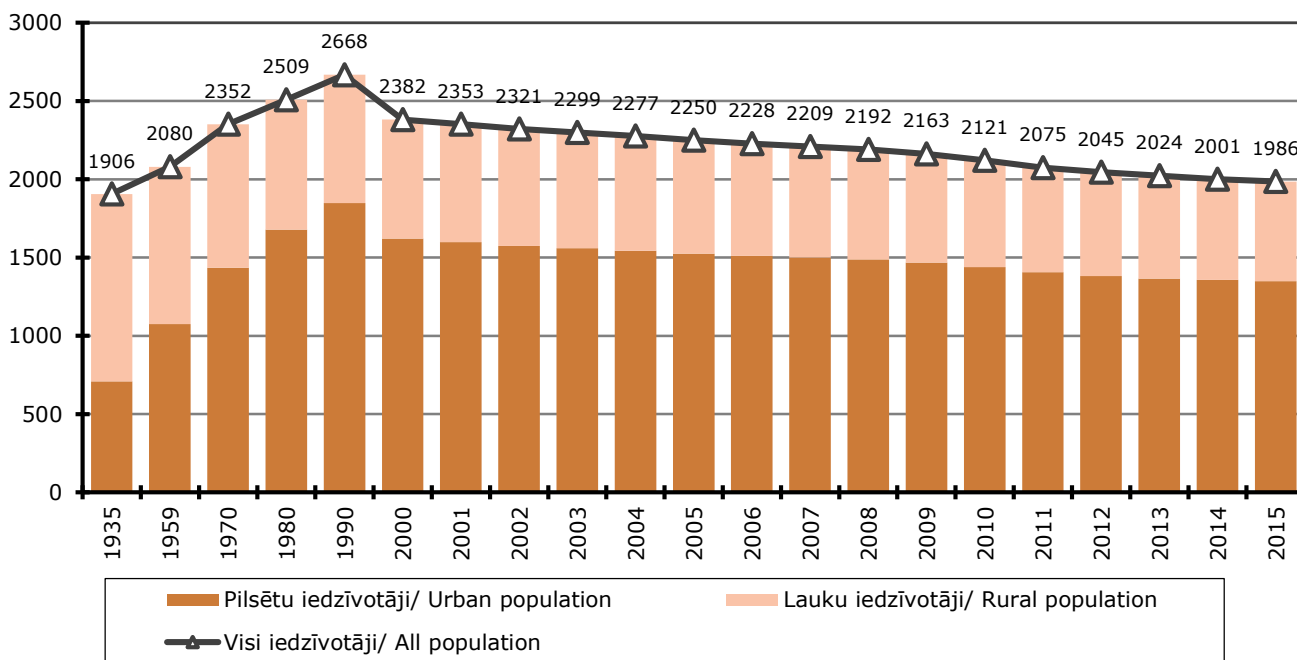

Total fertility rate - the average number of children that would be born to one woman during her lifetime if the age-specific fertility rate observed for that year would apply for her whole life.

Total marriage rate - the average number of marriages for males and females of the respective generation during their lifetime.

Usual residence - according to regulation of the European Commission No 1260/2013, means the place where a person normally spends the daily period of rest, regardless of temporary absences. Person arrived in their place of usual residence during the 12 months before the reference time with the intention of staying there for at least one year.
